

INTRODUCTION

Urinary and bowel incontinence affects a significant proportion of the older adults. Loss of normal bladder and bowel control adversely affects the physical, psychological and social aspects of older people's lives. Many of the nursing home residents suffering from these conditions may have both physical and cognitive problems that prevent them from using the toilet independently.

Incontinence is not a normal consequence of aging and can be difficult to address. Health-care professionals play a key role in assessing nursing home residents and helping them to manage their incontinence issues.
